## I. Introduction

---

### 1. General Introduction

---

The following user manual is meant to guide you in the installation process of your 4G+ ROUTER 1200. For this purpose, we will detail the process to set up your device and network. In addition, we will present you the process to connect to Web UI and the different parameters that you can set, as well as the meaning of the LEDs that you can see on your device.

### 2. Presentation of the Device and its LEDs

---

Congratulations, you bought one of our 4G routers, now it is the time to present the device before configuring it for its first use.

The 4G+ ROUTER 1200 works with a full-size SIM card that must be inserted in the SIM card slot with an adapter, depending on the size of the SIM card provided by your service provider. This manipulation must be done before switching on the device. Moreover, for your network to work you might need to unlock the SIM card by entering its pin code in the Web UI, for more information please see, [inserting your SIM card](#) and [entering your PIN code in the Web UI](#).

Our router is equipped with two external antennas that you have to install in the dedicated slots on the rear side of the device.

On the front side of the device, you can see a few LEDs that give you information about the status of the network, Wi-Fi, WPS, etc.

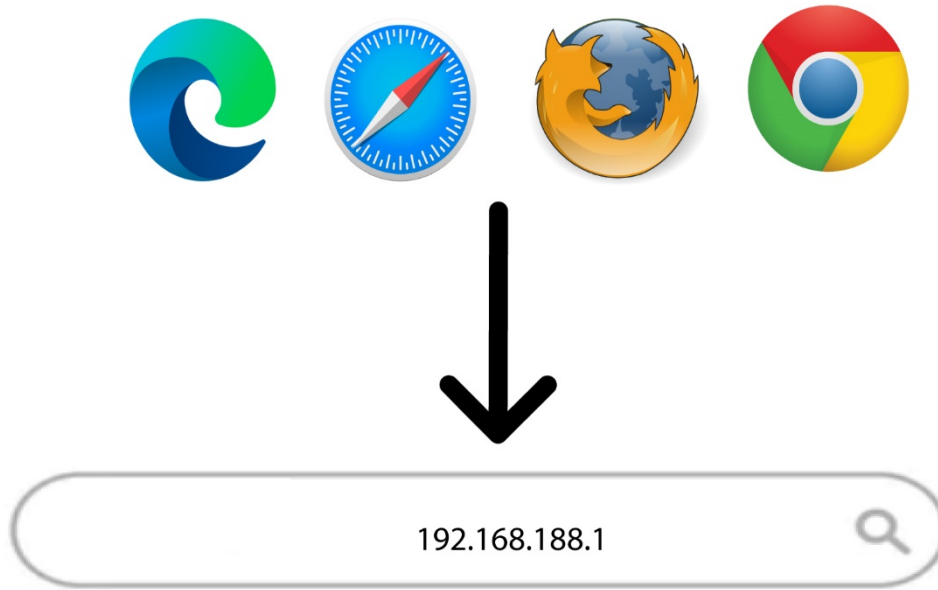

Let's see the different meanings of these LEDs in detail, in the following picture.

### 3. Presentation of the Web UI

The Web UI is the place where you can set up advanced parameters for your device but also customize your SSID, password and so much more.

1. The Web UI is accessible after connecting to the Wi-Fi of the device or to the internet connection of the router by using the Ethernet cable and entering the following IP Address in your browser:

2. Once you have entered the username and password, you can see that the Web UI is divided into seven categories:
- Home Page: where you can see the status of your connection, SIM Card and PIN Code.
  - Status: where you can see the information about the device, Internet, LAN and wireless connections.
  - Network: where you can set up the APN, change or enter the PIN code, WAN, LAN and Speed Limit.
  - Wireless: where you can set up WPS and Wi-Fi (SSID (Wi-Fi Network Name) and Wi-Fi password change, guest Wi-Fi, etc.)
  - Security: where you can set up a firewall, URL/MAC filters, IP filters and parental/service control.
  - Application: where you can set up DNZ, DDNS, UPnP settings and IGMP.
  - Administration: where you can update the firmware, change the username and password, languages, reboot the device, reset to factory settings, etc.

**STRONG** Upgrade  Logout  Reboot[Home Page](#) | [Status](#) | [Network](#) | [Wireless](#) | [Security](#) | [Application](#) | [Administration](#)

## II. Configuring your Device and Network

### 1. Inserting your SIM card

When you are setting up your device, the first step is to insert your SIM card as it is used as the source of your internet connection. A full-size SIM card must be inserted in our device. If your SIM card is micro or nano, please place the SIM card in the adapter provided in the package.

1. To place your SIM card in the dedicated slot: follow the procedure below:

- Case 1: Micro SIM Card

### MICRO SIM CARD TO FULL SIZE SIM CARD STEP BY STEP

- Case 2: Nano SIM Card

### NANO SIM CARD TO FULL SIZE SIM CARD STEP BY STEP

## 2. Placing the antennas

After installing your SIM card, you must remove the cover located on the top rear side of your device to place the two external antennas as follows:

### 3. Switching on the device

1. After that, you must insert the power cable in the power hole **(A)** and plug it into the outlet **(B)**. Then press the **Power** button **(C)**.

2. After a few seconds, the LEDs located on the front side of the device are lit if the sim card is unlocked.

LEDs are blue if the SIM card is not protected by a PIN code.

3. When the SIM card is protected by a pin code, only the Wi-Fi and power LEDs are lit.

LEDs are grey if the SIM card is protected by a PIN code.

1. In this case, you will need to connect to the Web UI of the device to unlock it. You can either access the Web UI after connecting your computer to the router with the RJ45 cable or to the Wi-Fi of the router after typing this IP Address: **192.168.188.1**.

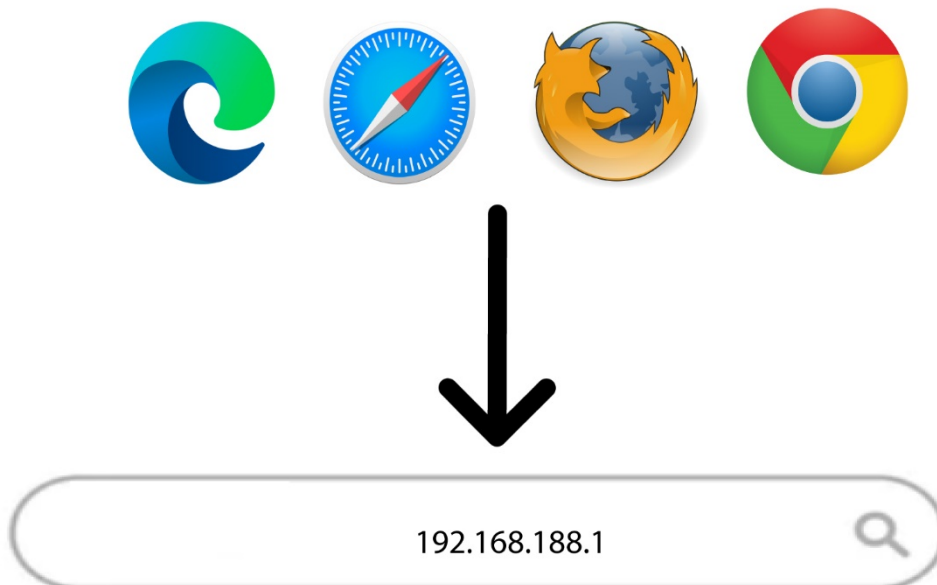

## 4. Connecting your Device with an Ethernet Cable and Accessing the Web UI

Once, your SIM card is installed and after switching on the router, you can connect the device to your computer to access the Web UI if you need to enter the PIN code.

1. To do so, insert the RJ45 cable in the **WLAN** hole located on the rear side of the device. Connect the other side of the cable to your device, as shown in the schema below:

2. Then you can access the Web UI by typing this **IP Address** in your browser:

3. Next, you must enter the **Username** and **Password**. Click **Login**.

Model: 4G+Router1200

## 5. Connecting to the Wi-Fi and Accessing the Web UI

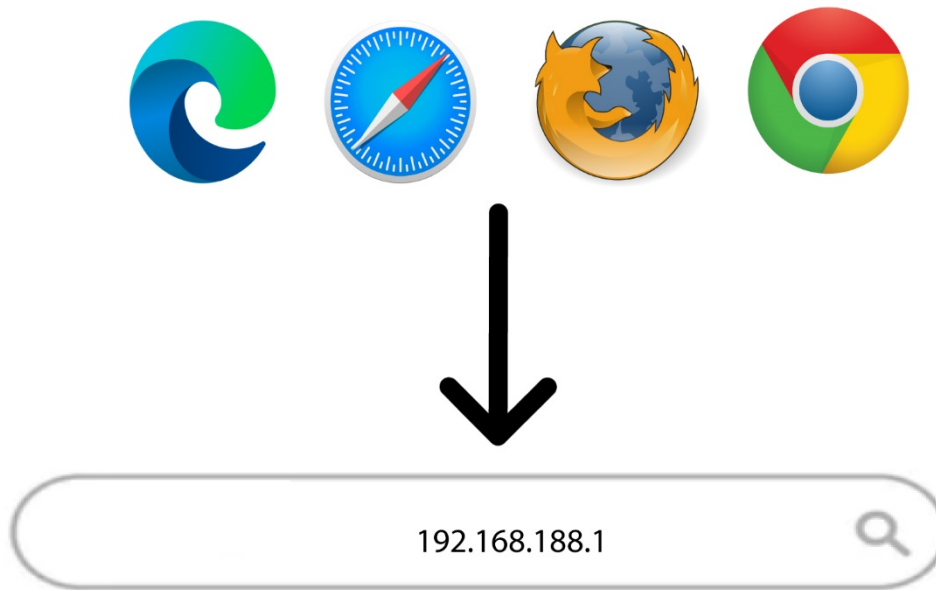

You can connect any compatible device to the Wi-Fi of your device and access the Web UI to customize your configuration.

- To connect to the Wi-Fi, look at the rear side of your router and locate the sticker where the **SSID** and **Password** are written. Then, enter the information in your device.

- Then enter the following IP address in your browser: **192.168.188.1**

3. A new page opens in which you must enter the **Username** and **Password** before clicking the **Login** button.

Model: 4G+Router1200

**⚠ Please note that we strongly advise you to change the admin password. If you decide to change it, your new password must contain at least 8 characters with upper and lower cases, number, and special characters. We strongly suggest using the same password as the one used for the Wi-Fi connection, as this password is unique for your device.**

For more information about the process to change your password, please refer to [Changing the administrator password in the Web UI](#).

4. Once you are connected to the Web UI, you will see the home page:

## 6. Changing the administrator password in the Web UI

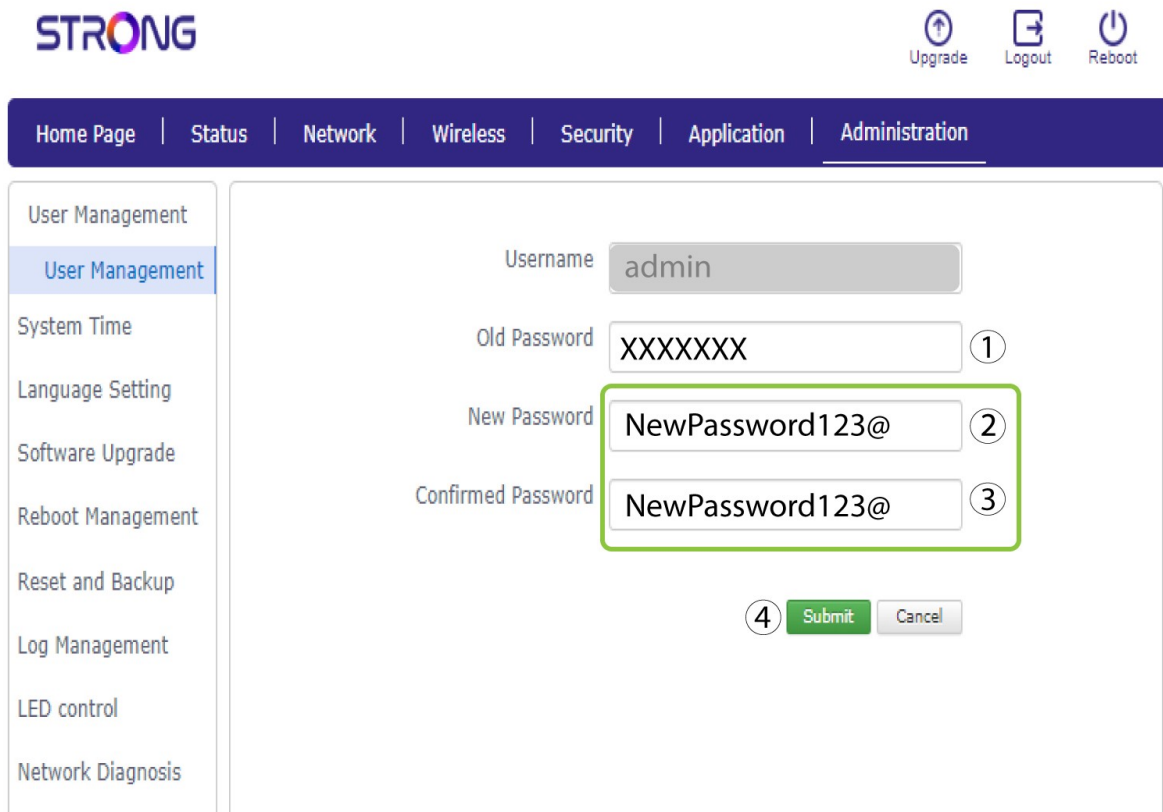

We strongly recommend updating the administrator password and username once you're connected to the Web UI, and after you set up all the necessary parameters for your device.

**⚠ Please note that we strongly advise you to change the admin password. If you decide to change it, your new password must contain at least 8 characters with upper and lower cases, number, and special characters. We strongly suggest using the same password as the one used for the Wi-Fi connection, as this password is unique for your device.**

- To do so, you must connect to the Web UI according to the process described in:
  - [Connecting your Device with an Ethernet Cable and Accessing the Web UI](#)
  - Connecting to the Wi-Fi and Accessing the Web UI
- Once this is done, click **Administration** and **User Management**.

The screenshot displays the STRONG Web UI interface. At the top, the 'STRONG' logo is on the left, and 'Upgrade', 'Logout', and 'Reboot' icons are on the right. A dark blue navigation bar contains links: 'Home Page', 'Status', 'Network', 'Wireless', 'Security', 'Application', and 'Administration' (which is highlighted with a circled '1'). Below this, a sidebar on the left lists various management options: 'User Management', 'System Time', 'Language Setting', 'Software Upgrade', 'Reboot Management', 'Reset and Backup', 'Log Management', 'LED control', and 'Network Diagnosis'. 'User Management' is highlighted with a circled '2'. The main content area shows a form for changing the administrator password. It includes a 'Username' field with 'admin' entered, and three empty fields for 'Old Password', 'New Password', and 'Confirmed Password'. At the bottom right of the form are two buttons: a green 'Submit' button and a grey 'Cancel' button.

- Enter the following information in the fields before clicking **Submit**:
  - Old Password:** Enter the current password that you used to connect to the Web UI.
  - New Password:** Enter a new password to connect to the Web UI.
  - Confirmed Password:** Enter the same password as in the New Password field.

## 7. Entering your PIN code in the Web UI

After inserting your sim card and switching on the device, you might need to connect to the Web UI if you notice that the network signal LEDs are not lit and that the vertical arrows are white or red, which can indicate that your SIM card is locked by the PIN code and/or not properly detected.

1. In this case, you must [connect to the Wi-Fi of the device and access the Web UI](#).
2. When you are connected to the Web UI for the first time, you will see a warning message that invite you to enter the PIN code by clicking the **connection** button.

- Enter your PIN code in the field and click **submit**.

- The SIM card is unlocked, and its icon now turns green with the network name next to it.

## 8. Enabling/Disabling the Wi-Fi

If you prefer to use your router by connecting it directly to your device with an Ethernet cable, it is possible to deactivate the Wi-Fi.

1. To do so, you must connect to the Web UI by using an Ethernet cable by following [this procedure](#).
2. Click **Wireless** and select **Wi-Fi Settings**.

The screenshot displays the router's configuration interface. The top navigation bar includes links for Home Page, Status, Network, **Wireless** (selected), Security, Application, and Administration. A circled '1' highlights the 'Wireless' tab. On the left sidebar, under the 'Wireless' section, 'Wi-Fi Settings' is selected, indicated by a circled '2'. The main settings area for Wi-Fi includes:
 

- Enable Wi-Fi**: A green toggle switch is turned on.
- Dual frequency optimization**: A grey toggle switch is turned off.
- Enable 2.4GHz Wi-Fi**: A green toggle switch is turned on.
- Wi-Fi Name**: A text field containing 'STRONG\_H3Kb\_2.4GHz' with a note '(1 ~ 32 Chars)' below it.
- Security**: A dropdown menu set to 'WPA/WPA2-PSK Mixed mode'.
- Wi-Fi Password**: A masked text field with dots and an eye icon, with a note '(8 ~ 63 characters)' below it.
- Wi-Fi Advanced options**: A grey toggle switch is turned off.
- Enable 5GHz Wi-Fi**: A grey toggle switch is turned off.

 At the bottom right, there are 'Submit' and 'Cancel' buttons.

- Case 1: deactivating both networks
1. Then, click the **Enable Wi-Fi** toggle to deactivate both networks.

## 9. Editing the APN Settings

We recommend editing the APN settings only if you are not receiving any signal from the SIM card inserted in the device, only after checking that the SIM card is properly inserted and unlocked by entering its PIN code in the Web UI. For more information about the way to insert your SIM card, please see [Inserting your SIM card](#). For more information about the procedure to enter your PIN code, please see [Entering your PIN code in the Web UI](#).

- To connect to the Web UI and perform this procedure, please see :
  - [Connecting to the Wi-Fi and Accessing the Web UI](#).
  - [Connecting your Device with an Ethernet Cable and Accessing the Web UI](#)
- Click **Network** and then **APN**.

The screenshot shows the STRONG router's Web UI. At the top right are icons for Upgrade, Logout, and Reboot. A dark blue navigation bar contains links: Home Page, Status, Network (1), Wireless, Security, Application, and Administration. On the left, a sidebar lists Mobile Network options: Connection, APN (2), Uplink Mode, WAN, LAN, and Terminal Device. The main content area displays the APN configuration: 'Auto APN' is a green toggle switch; 'Profile' is a dropdown menu showing '2'; 'APN' is a text field containing 'mmsbouygtel.com'; and 'Single PDN' is a grey toggle switch. At the bottom right of the main area are 'Submit' and 'Cancel' buttons.

- Check the following information:

Name
APN
Username
Password
Authentication Type

4. If the information is incorrect, click the **Auto APN toggle** and enter the following information before **Submit**:

- Select the **Authentication Type: NONE, CHAP or PAP**.
- Enter the name of your service provider in the **Profile Name** (Limited to 14 characters including spaces). Then enter the APN address in the **APN** field.
- In the **PDP Type** field, select the APN Type: **IPv4, IPv6 or IPv4v6**.

## 10. Activating the WPS

1. Press the WPS button for 2 seconds to allow any compatible device in your home to automatically connect to the Wi-Fi network of the router. Once it is activated, the horizontal arrows  will blink in blue.

2. Go to the Wi-Fi settings of your computer and click on the name of the router to select it.

3. Then, click the connect button.

## 11. Resetting the device to its factory configuration

---

Sometimes, it is possible that your device is not working properly and that you don't have internet access. In this case, we suggest resetting your device to its factory settings and updating it afterward if necessary.

You have two ways to do it; you can reset the device by pressing the reset button or doing it in the Web UI.

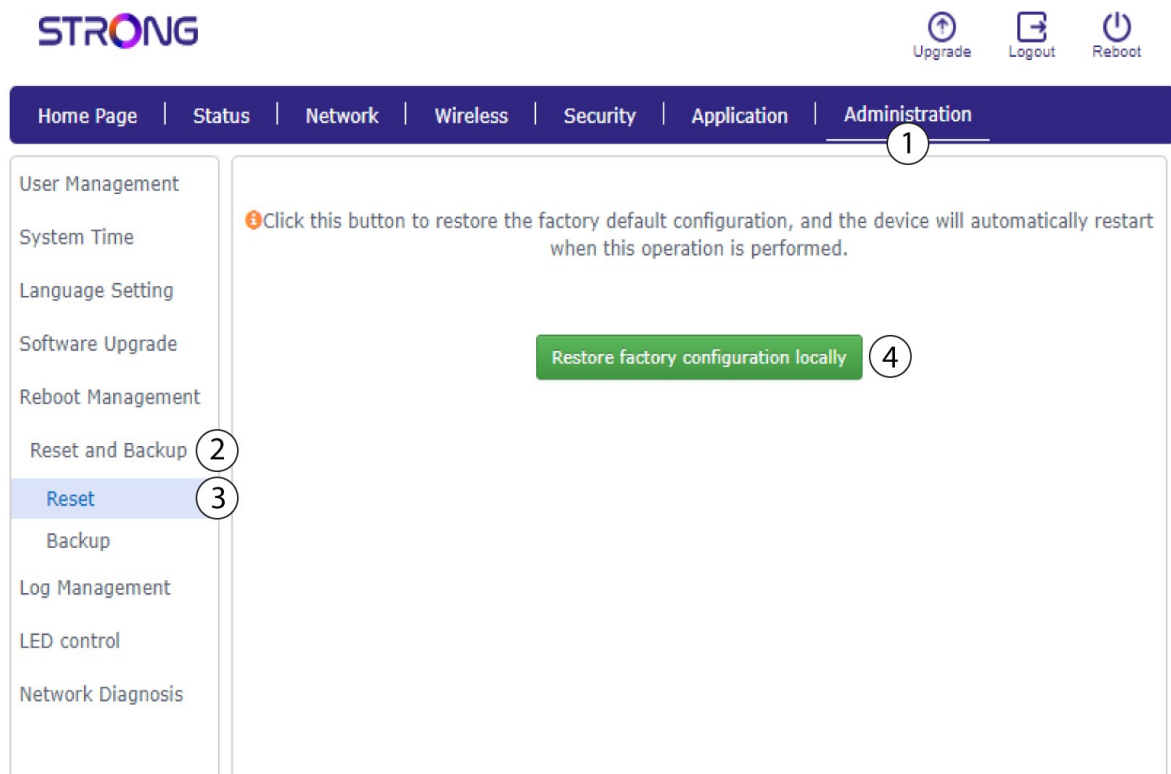

- **CASE 1: Reset button.**

To do so, insert a paper clip in the hole to press the reset button. Press the reset button for 10 seconds. The LEDs will switch off and turn back on again.

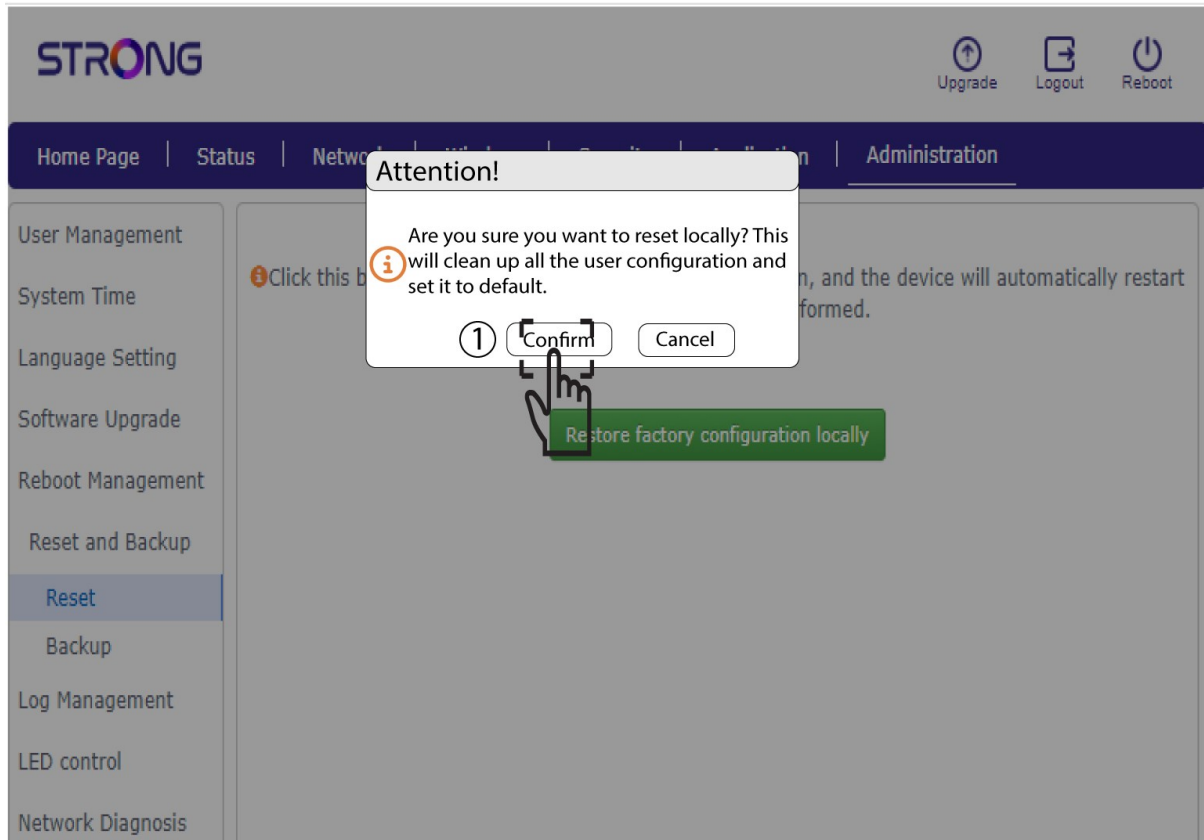

### • CASE 2: Reset in the Web UI

1. To connect to the Web UI, please see the following procedures: [Connecting your Device with an Ethernet Cable and Accessing the Web UI](#) and [Connecting to the Wi-Fi and Accessing the Web UI](#)
2. Then, click **Administration** and **Reset and Backup**. Then, click **Reset** and **Restore Factory configuration locally**.

3. Click **Confirm** on the pop-up message that appears.

### III. Using the Web UI

Once you have configured your device and network, you can customize some settings. For instance, you can decide to deactivate/edit your PIN code, edit the SSID and password, and update the firmware.

#### 1. Disabling your PIN code

It is not possible to deactivate your PIN code in the Web UI.

#### 2. Changing the PIN code

It is not possible to change your PIN code in the Web UI.

### 3. Changing the SSID (Wi-Fi Network Name) and password

After setting up your device and connecting to it for the first time, it is possible for you to change the SSID, also known as the name of your Wi-Fi Network and its password.

**Warning:** Please note that we strongly recommend using a network name and password that is different from the one of your Internet box. Why? As you may know, your devices automatically connect to the known networks, so if you put the same names and password for your router network and your Internet box, you will not be able to differentiate them.

- To change the SSID and/or password of your network, you must connect to the device Wi-Fi or Internet connection by following one of these procedures:
  - [Connecting to the Wi-Fi and Accessing the Web UI](#)
  - [Connecting your Device with an Ethernet Cable and Accessing the Web UI](#)
- Click **Wireless** and select **Wi-Fi Settings**.

- Change the name entered in the **Wi-Fi Name** field and click the eye icon next to the **Wi-Fi Password** field. Then change the password entered in the **Wi-Fi Password** field and click Submit to save the changes.

## 4. Updating the device Firmware

If you notice that your device does not recognize your SIM card properly or that the user interface is not available in your language when connecting to the UI for the first time. Please check the firmware version used by your device by using the online upgrade option in the Web UI. By doing so, the latest firmware version will be installed.

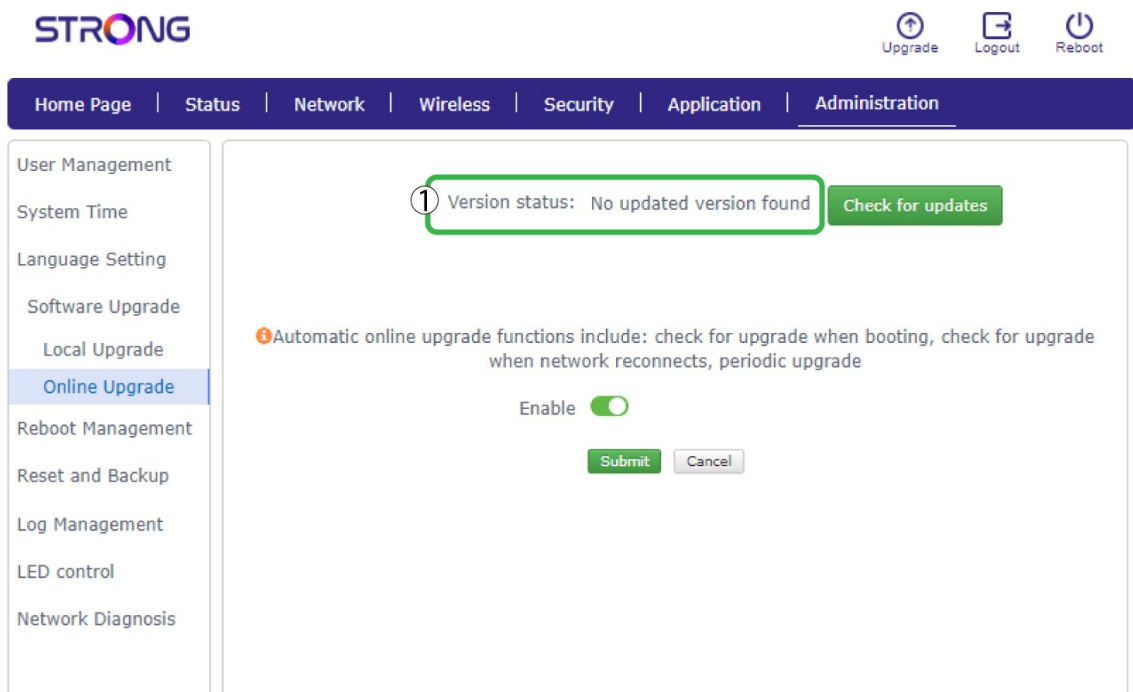

- To do so, connect to the Web UI, please follow on these procedures:
  - [Connecting your Device with an Ethernet Cable and Accessing the Web UI](#)
  - [Connecting to the Wi-Fi and Accessing the Web UI](#)
- Click **Administration** and select **Online Upgrade**.

- In Advanced Settings, click **Check for updates** and the **Enable** toggle button. Then, click **Submit**.

4. A message appears to tell you if there is a new version available.

5. If there is a new version available, click Yes. Then wait for the router to complete the update. The LEDs will turn off and turn back on.

## IV. Customized Settings

---

### 1. Network Settings

---

In the Device Settings section of the UI, you can set different basic parameters regarding your network and advanced parameters according to your needs.

#### 1.1. Mobile Network

---

The basic settings that you can configure in the Network settings are divided into three categories: Mobile Network, LAN, and Terminal Device.

## 1.2. Connection

The first section that you can see in the Internet Settings page is called Connection.

You can see the preferred mobile network, PIN Code and if mobile data and data roaming and 3<sup>d</sup> party antennas are activated.

The screenshot shows the 'Connection' tab in the Internet Settings page. The left sidebar lists 'Mobile Network' with sub-items: 'Connection' (selected), 'APN', 'Uplink Mode', 'WAN', 'LAN', and 'Terminal Device'. The main content area contains the following settings:

- Mobile data**: A toggle switch that is turned on, labeled with a circled 1.
- Data roaming**: A toggle switch that is turned on, labeled with a circled 2.
- Preferred network mode**: A dropdown menu set to 'Auto', labeled with a circled 3.
- The 3rd party antennas**: A toggle switch that is turned on, labeled with a circled 4.
- PIN**: A text input field containing four dots, with a 'PIN code OK' message below it.
- Submit** and **Cancel** buttons: Located at the bottom right, with the 'Submit' button labeled with a circled 5.

### 1.3. Uplink Mode

In the Network Settings, you can set up the uplink mode for WAN/LAN ports on your router.

1. To do so, click **Network** on the top bar, then click **Uplink Mode**.

Home Page | Status | **Network** | Wireless | Security | Application | Administration

## 2.2. IPv6 Configuration

You can enable the DHCP services

1. Click **Network**, **LAN** and **IPv6 configuration**

The screenshot displays the IPv6 Configuration page. The navigation menu on the left shows 'Network' (1), 'LAN' (2), and 'IPv6 Configuration' (3) selected. The main configuration area includes the following fields and controls:

- LAN IP Address:** fe80::a:1 / 64
- Enable DHCP service:** Toggle switch (off)
- DHCP Start IP Address:** :: (last 64 bits effective)
- DHCP End IP Address:** :: (last 64 bits effective)
- DNS Refresh Time:** 86400 sec
- LAN side DNS acquisition mode:** HGWProxy
- Prefix:** 2a04:cec0:1089:aaa::
- prefix len:** 64 (48~64)
- Enable RA:** Toggle switch (on)
- Minimum Wait Time:** 200 (3 ~ 1350)
- Maximum Wait Time:** 600 (4 ~ 1800)
- M:** Toggle switch (off)
- O:** Toggle switch (on)

Buttons: Confirm, Cancel

2. Click the **Enable DHCP** toggle button, enter the start and end IP Addresses for the DHCP (IP Address between 192.168.1.2 to 192.168.1.99 to prevent conflicts). Then, click Confirm.

## 2.3. Static IP

If you are using several devices and you need them to have a static IP address on your network, you can enter the MAC Address of your device and set up the static IP.

1. To do so, you must connect to the Web UI by following one of these procedures:

- [Connecting your Device with an Ethernet Cable and Accessing the Web UI](#)
- [Connecting to the Wi-Fi and Accessing the Web UI](#)

2. Click **Network** and **LAN**.

Home Page | Status | **Network** | Wireless | Security | Application | Administration

### 3. Terminal Device

In this part of the Web UI, you can set up the speed limits of the router Internet Connection.

#### 3.1. Device Control

1. Click **Network** and **Terminal Device**.

The screenshot shows the Web UI navigation bar with 'Network' selected. On the left sidebar, 'Terminal Device' is selected. The main content area displays a table with columns: Device Type, Device Information, and Speed limit. The 'Terminal Device' row shows a device named 'Emmy' with IP Address: 192.168.188.3, MAC Address: E0:0A:F6:9B:BE:65, and online time: 7min45sec. The speed limit is currently set to 0 kbps for both upload and download. A 'Confirm' button is visible. A tip box below the table states: '1. The network speed limit is set to 0kbps to indicate unlimited speed' and '2. If the device needs to control the Internet time, please go to or click: [Parental control](#)'.

2. In the Device control section, enter the maximum speed limits for upload and download and click **confirm**.

The screenshot shows the Web UI navigation bar with 'Network' selected. On the left sidebar, 'Terminal Device' is selected. The main content area displays a table with columns: Device Type, Device Information, and Speed limit. The 'Terminal Device' row shows a device named 'Emmy' with IP Address: 192.168.188.3, MAC Address: E0:0A:F6:9B:BE:65, and online time: 7min45sec. The speed limit is now set to 2000 kbps for both upload and download. A 'Confirm' button is visible. A tip box below the table states: '1. The network speed limit is set to 0kbps to indicate unlimited speed' and '2. If the device needs to control the Internet time, please go to or click: [Parental control](#)'.

## V. Wireless Settings

You can set up the settings for the guest Wi-Fi and main Wi-Fi network as well as the duration of the Wi-Fi activation, a blacklist for device that cannot use your network.

### 1. Wi-Fi Settings

You can configure your 2.4 and 5 GHz Wi-Fi networks.

#### 1.1. 2.4 GHz Wi-Fi

You can set a new name and password for your Wi-Fi Network, for more information please see: [Changing the SSID \(Wi-Fi Network Name\) and password](#).

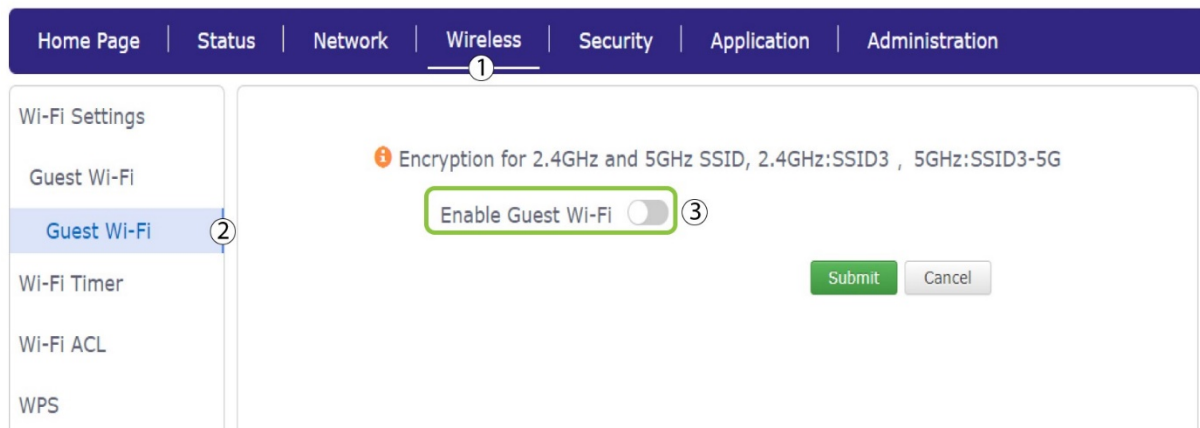

#### 1.2. 5 GHz Wi-Fi

You can setup a new name and password for your Wi-Fi Network, for more information please see: [Changing the SSID \(Wi-Fi Network Name\) and password](#).

### 2. Guest Wi-Fi

If you do not want your guest to use your main Wi-Fi network for security reasons, you can easily set up a guest Wi-Fi network.

1. Click Wireless and Guest Wi-Fi

2. Configure the Wi-Fi Name and password. Enter a work time in minutes before clicking submit.

## 4. Wi-Fi ACL

You can create a blacklist of devices that cannot connect to your device or a whitelist to allow specific devices to connect to your network.

1. Click **Wireless** and **Wi-Fi ACL**.

2. Click the Enable wireless access device control toggle button. Then, choose discard or permit according to your needs and click **Add**.

3. Enter the device name and its **MAC Address** and click **Confirm**.

## 5. WPS

You can change the WPS connection method or disable the WPS.

### 5.1. Activating the WPS

There are two connection methods for your WPS:

- Push Button mode: If you select the first option, your devices will connect to the WPS after pressing the WPS button for two seconds. To activate the WPS please follow [this procedure](#).
- PIN: If you select the PIN option, a PIN code will be generated on the device that you want to connect and you will have to enter it in the Web UI before clicking **Submit**.

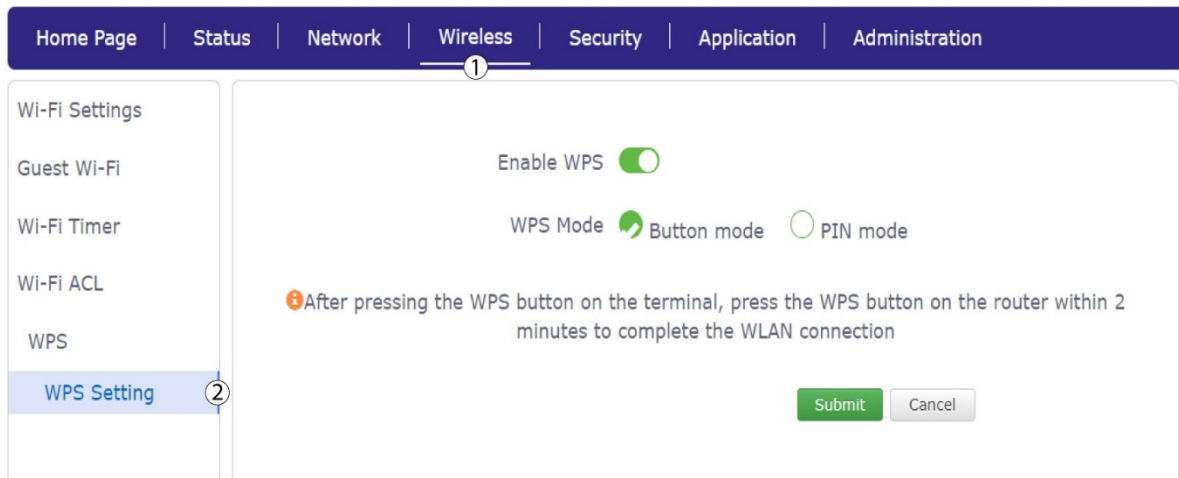

①Please note that the WPS PIN code is not related in any way to the SIM Card PIN code. The WPS PIN code is a different PIN code that is only used to connect devices of your home to the Wi-Fi network of the 4G Router 300V2.

Once, you connected your devices by using one of the WPS methods mentioned above, they will automatically connect to the network.

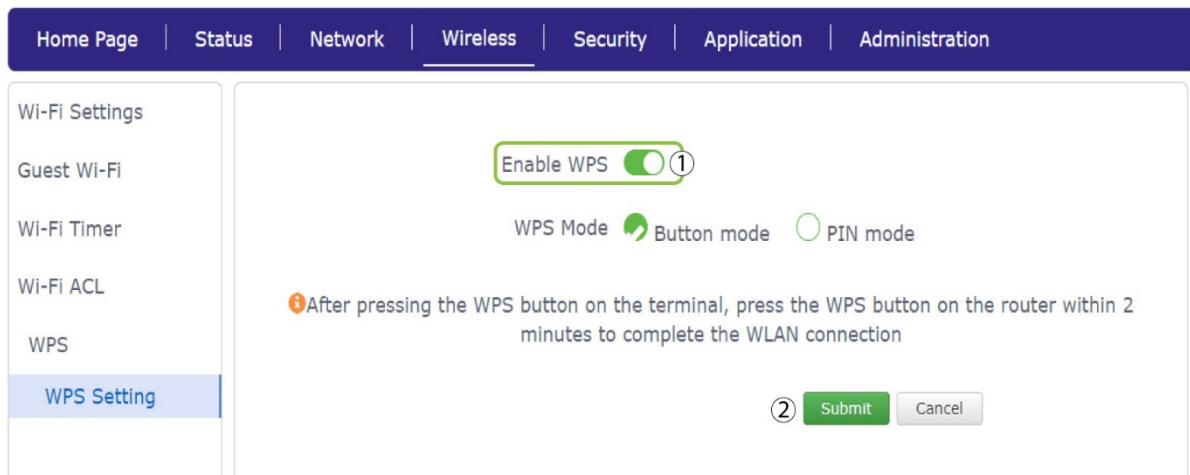

## 5.2. Deactivating the WPS

The following section explains how to deactivate the WPS connection of your router.

1. To deactivate the WPS option, click **Wireless** and **WPS**.

2. Click the **Enable WPS** toggle button and click **Submit**.

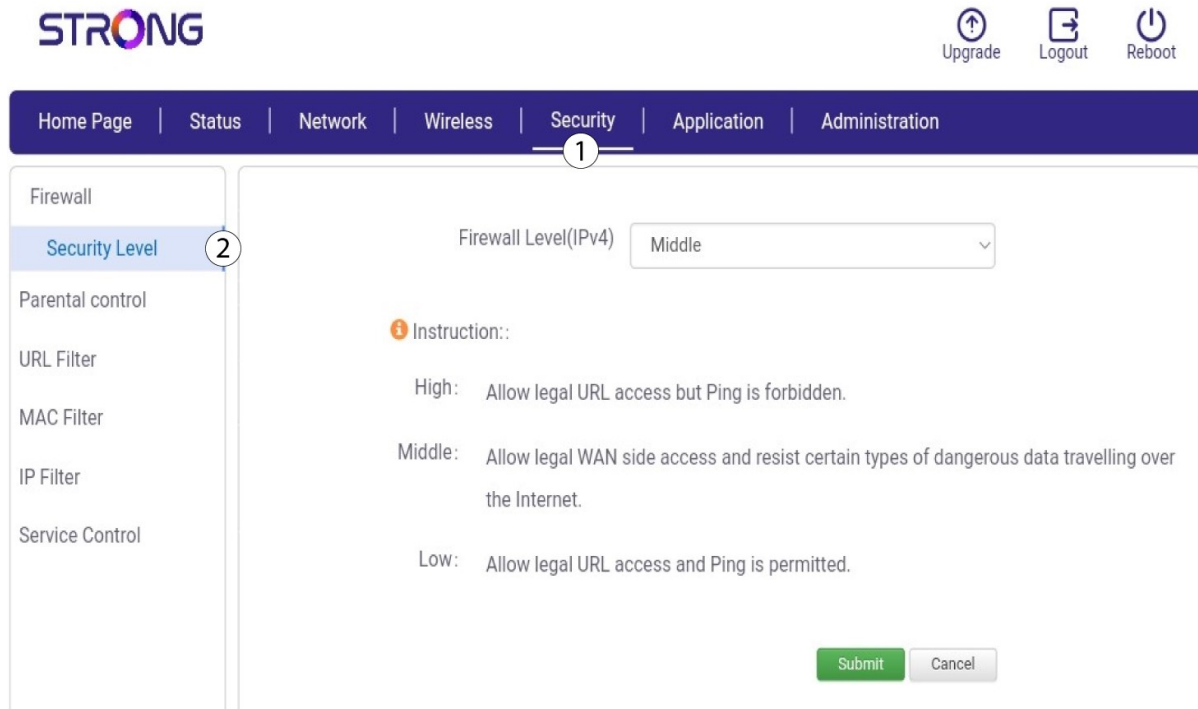

## VI. Security

### 1. Firewall

#### 1.1. Security Level

You can change the Firewall security level to prevent hacking.

1. Click **Security** and **Firewall**.

2. Select a value in the list before clicking **Submit**. We recommend setting the firewall on Middle or High to prevent hacking.

## 4. MAC Filter

In the router, it is possible to create a whitelist and/or a blacklist that contains the list of MAC addresses for allowed or forbidden devices. Depending on the list in which the device's MAC address appears, its connection to the router will be either authorized or forbidden.

MAC Filtering prevents unwanted connection on your network by only allowing the connection to the registered devices. Every device that can connect to the Internet has a MAC Address. A computer has several MAC addresses, one for the Wi-Fi Network and two for the LAN. If you plan to use your computer with the LAN and/or Wi-Fi, please enter both addresses. To find the Mac Address of your computer or phone look for the information in the device information in the settings.

Write down the MAC addresses before entering them into the Web UI. This way you will be able to use your computer in Wi-Fi or by plugging an ethernet cable.

1. Click **Security** and **Mac Filter**.

## VII. Application Settings

In this part of the Web UI, you can edit the DDNS, DMZ Host, IGMP Settings and UPnP Settings.

### 1. DDNS

Dynamic DNS (DDNS) is used to automatically update a DNS Server. You can choose between two DDNS provider in the Web UI, you will have to create an account and register before being able to set up the DDNS for the router.

1. To configure your DDNS, please follow one of the procedures below to access the Web UI:
  - [Connecting your Device with an Ethernet Cable and Accessing the Web UI](#)
  - [Connecting to the Wi-Fi and Accessing the Web UI](#)
2. Click **Application** and **DDNS**.

## 2. DMZ Host

A Demilitarized Zone (DMZ) is a subnetwork that is separated and isolated from the main local network (LAN) and from Internet by a Firewall. On this network, you can configure the devices that needed to access the Internet without accessing your LAN.

1. To configure DMZ on your router, you must be connected to the Wi-Fi of the router and access the Web UI. Please refer to the following procedures to connect to Web UI:
  - [Connecting your Device with an Ethernet Cable and Accessing the Web UI](#)
  - [Connecting to the Wi-Fi and Accessing the Web UI](#)
2. Click Application and DMZ Host.

### 3. IGMP Settings

Internet Group Management Protocol (IGMP) is used by devices to report their multicast group membership to a router. It works with an IPv4 configuration.

#### 3.1. IGMP Snooping

IGMP Snooping is a feature that allows your router to monitor IGMP membership messages to learn about multicast group members and their connected interfaces. It is mainly used by your router to forward a specific multicast group traffic to only members of that specific multicast group.

1. To configure IGMP Snooping, click **Application** and **IGMP Settings**.

2. Click the **IGMP Settings** toggle button and then click **Submit**.

## 4. System Update

### 4.1. Local Update

Before starting the Local Update, you must browse to [STRONG's website](#).

1. Once you are on the website click **Support** and **Download**. Then select **Mobile BroadBand** and **4G+ LTE Router | 4G+ROUTER1200**.
2. The new software versions are located under the download section of the page under the software category.
3. Download the file if there is one. Then, connect to the Web UI and click **Administration** and **Software Upgrade**. Click the **Choose a file** button and click **Upgrade**.

### 4.2. Online Update

To do an automatic online update please refer to the procedure below:

- [Updating the device Firmware](#)

## 5. Reboot Management

### 5.1. Reboot

You can reboot your router in the Web UI;

1. Click the **Reboot** button in the top bar of the Web UI. Then, click **Confirm**.

## Reboot

 Are you sure to reboot the device?

Cancel

Confirm ②

## 5.2. Reboot on time

You can setup times and days on which your router will automatically reboot.

1. Click **Administration** and **Reboot Management**. Then, select **Reboot on time**.

## 6. Reset and Backup

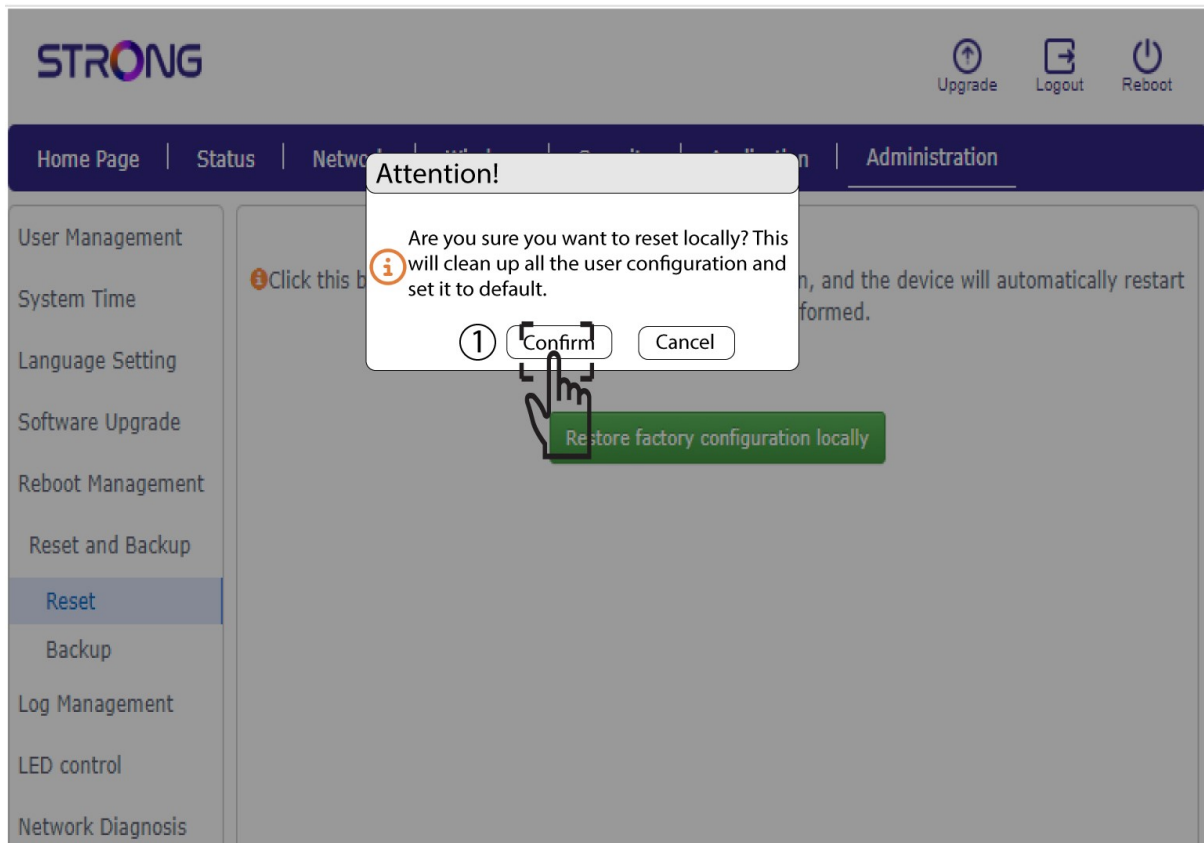

### 6.1. Reset

You can reset your router to its factory settings in the Web UI.

1. Click **Administration** and **Reset and Backup**. Then, click **Restore factory configuration locally**.

2. Click **Confirm**.

## 6.2. Backup

You can backup your configuration through the Web UI before doing an update.

1. Click **Administration and Reset and Backup**. Then select **Backup**.

2. Click **Back up configuration file**. Then, after the update, click **browse** to select your file and **Load configuration file**.

 You can save your settings here. We recommend that you back up your configuration file before modifying the configuration and upgrading the software.

Backup configuration file

1

Path: select file 

Browse

2

Load configuration file

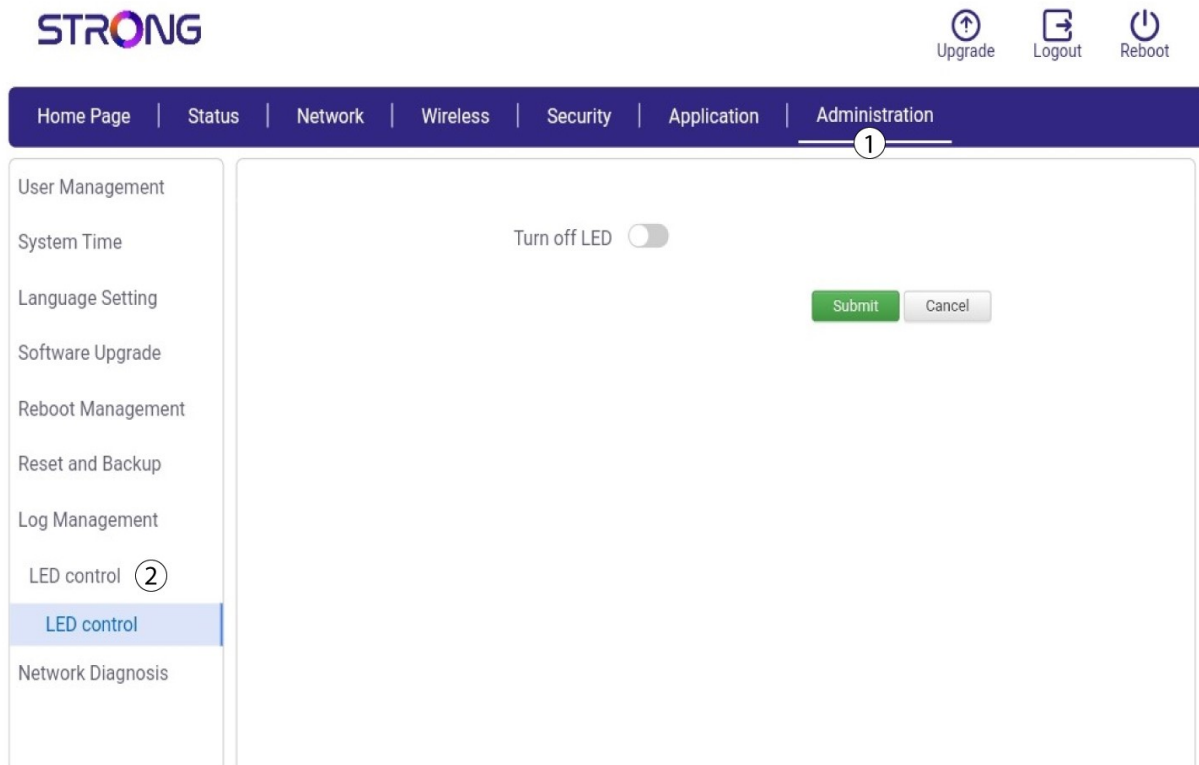

3

 **Note:** 1. After importing the configuration file, the original user configuration in the device will be lost. If you load the wrong configuration file, the device may not be managed. 2. The power of the router cannot be turned off during the process of loading the configuration file, otherwise the router will be damaged and unusable. The loading process is about 20 seconds, when the loading is over, the router will automatically restart.

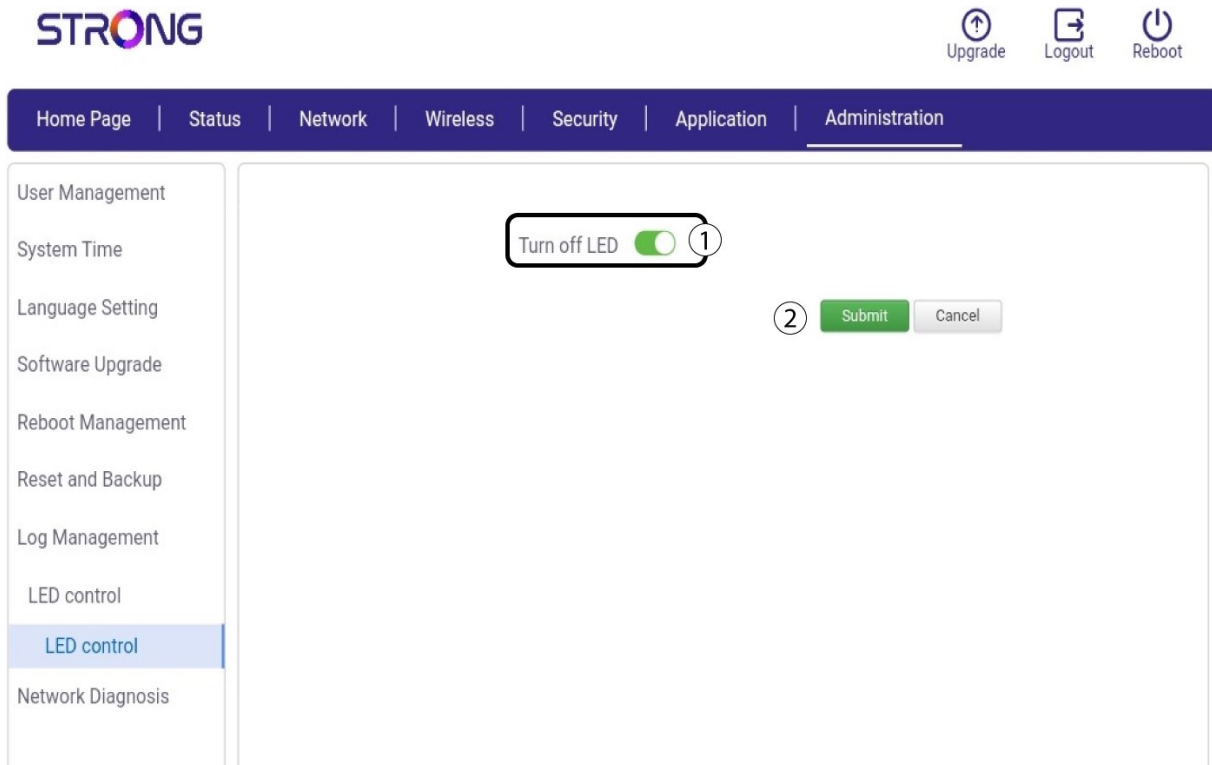

## 7. LED Control

Your router uses different LEDs on its front side to let you know the status of your network. You can deactivate the LEDs.

1. Click **Administration** and **LED Control**.

2. Click the **Turn off LED** and **Submit**

## 8. Network Diagnosis

### 8.1. Ping

When you use this feature, the router checks if the packets that are sent to the website or IP address you want to reach is available.

1. To do so, connect to the Web UI by following one of these procedures:
  - [Connecting your Device with an Ethernet Cable and Accessing the Web UI](#)
  - [Connecting to the Wi-Fi and Accessing the Web UI](#)
2. Click **Administration** and Network **Diagnosis**.

## 8.2. Trace

When you enter an IP address or a URL, you can see the route followed by the packets of your LAN to access the internet and reach a website or the device IP Address you entered.

- To do so, connect to the Web UI by following one of these procedures:
  - [Connecting your Device with an Ethernet Cable and Accessing the Web UI](#)
  - [Connecting to the Wi-Fi and Accessing the Web UI](#)
- Click **Administration** and **Network Diagnosis**. Then, select **Trace Route Test**.
