Introduction

Texecom has developed a new method of wireless security signalling based on the concept of mesh networking. Mesh-networking is the process whereby every single wireless device is capable of receiving and retransmitting any signal from any other wireless device on the network. The size, scalability and range of the entire system are extended as wireless signalling is no longer limited by point-to-point communications. The range of a **Ricochet**® enabled wireless system is greater than previous systems, with multiple devices capable of relaying messages to and from even the most remote locations in a building. Each *Ricochet* enabled device provides signalling routes to and from Premier control panels. If the wireless communication between devices weakens, the *Ricochet* network 'self-heals' and automatically re-routes communications via alternate *Ricochet* enabled devices. The reliability of the wireless system increases as more *Ricochet* devices are installed. **SignalSecurity**™ further enhances network reliability with each device already aware of the number of communication paths available to it.

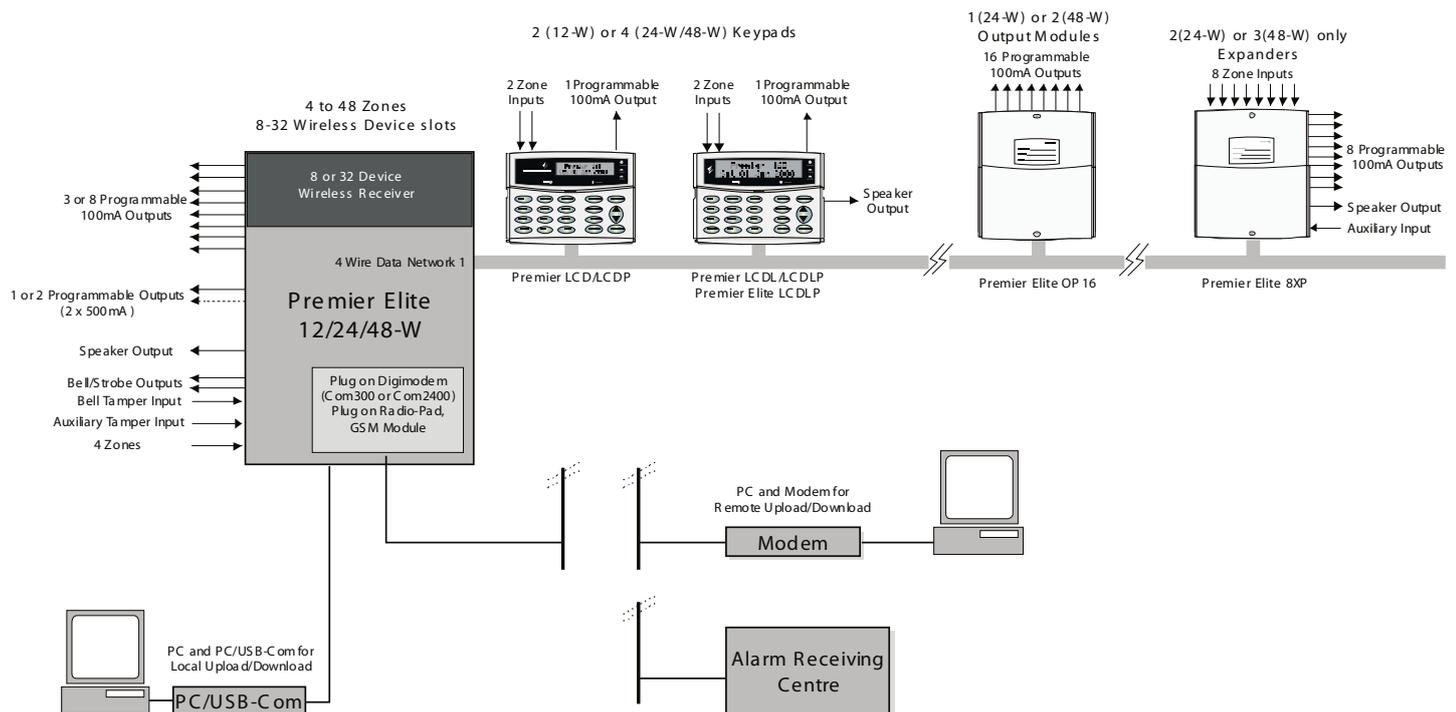

This quick start guide will enable you to install and programme the system. Detailed instruction manuals for all of the components of the kits can be found on the enclosed CD. Any additional items purchased will also contain detailed instructions.

Additional Items Required

In addition to the contents of the kit you will need the following to complete the installation:-

- 7Ah Lead Acid back up battery
- Alarm cable (if installing remote keypads or wired detection devices & sounders)
- Mains Cable
- 3A unswitched fused spur
- Screws & Rawl plugs (No6, No8 & No10)
- Hammer drill, various screwdrivers
- Mini Trunking.
- PC or Laptop running Windows Vista, 7 or 8 (If programming from a PC)
- JAC-0001 Texecom USB Com Lead (If programming from a PC)
- A cover for the External Sounder

System Architecture

System Design & Installation Considerations

Before attempting to install the alarm system, read this section. Once you have an overall understanding of the installation sequence, carefully work through each step.

This quick reference guide will allow you to install your alarm system and programme all of the required basic functions. Further in-depth programming options for the system are available in the manuals provided on the enclosed CD or on our website.

1: Design the Layout

Make a rough sketch of the premises to get an idea of where all alarm detection devices, keypads and other modules are to be located.

2: Arming/Disarming

It is highly recommended that SmartKey are used to arm and disarm the system. This will allow for the control panel and any associated keypads to be placed in a secure area in the property.

3: Control Panel Location

The control panel should be mounted in a dry area close to an unswitched AC power source.

You must complete all wiring before connecting the battery, or applying AC Mains to the panel.

Wiring the Control Panel

WARNING: ELECTRICITY CAN KILL

BEFORE connecting the control panel ALWAYS disconnect the supply at the consumer unit.

If in ANY doubt consult a qualified electrician.

IMPORTANT SAFETY INFORMATION. HAZARDOUS VOLTAGES INSIDE, NO USER SERVICEABLE PARTS, NO USER ACCESS.

ONLY connect the mains supply to the mains terminal block, NEVER connect the mains supply directly to the PCB.

- ALWAYS refer to National Wiring Regulations when conducting installation.
- An appropriate and readily accessible disconnection device (e.g. an unswitched fused spur) MUST be provided as part of the installation.
- The disconnection device must NOT be fitted in a flexible cord.
- Where identification of the neutral in the mains supply is NOT possible a two-pole disconnection device MUST be used.
- The building mains supply MUST incorporate appropriate short-circuit backup protection (e.g. a fuse or circuit breaker) of High Breaking Capacity (HBC, at least 1500A).
- Use mains cable of adequate carrying capacity for the rated current (i.e. at least 0.75mm²)

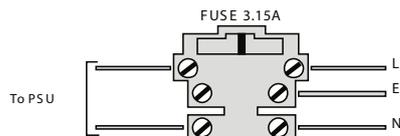

Connecting AC Mains

The AC Mains supply is connected to a 3 way 'Euro Type' fused terminal block, which is fitted with a 3A - 3.15A slow/medium blow fuse.

All other wiring MUST be carried out before AC mains is connected to the control panel.

After connecting the AC Mains, fit the mains cover, this can be found in the spares bag.

4: Install the Keypads

Where separate keypads are supplied, if using them to Arm/Disarm the system, these should be located on the entry route. Mount and connect the keypads to the control panel.

5: Zone Wiring

If any of the hardwired zones are to be used, Install detection devices and connect to the control panel.

6: Other Wiring

Complete all other wiring including bells or sirens and telephone line connections.

7: Apply Power to the Control Panel

Once steps 1 to 5 are completed, apply power to the control panel.

8: Installation Records

You should record notes detailing the location of each device installed on the system, and the date of installation.

9: Learning & Placing Ricochet Devices

Learn devices to the system and place them in their desired location.

10: Programme the System

Programme the system according to the requirements

11: Testing the System

Test the system thoroughly to ensure that all features and functions are operating as required.

Design the Layout

Depending on the Kit and any additional items purchased the system should be drawn out so that you have a clear idea of where all of the components will be placed. The following guide should help you plan a trouble free system.

Control Panel

- The control panel should be placed in a secure area within the property.
- Located near a suitable mains supply
- Centrally in the building wherever possible
- Easy to access for programming and maintenance

System Keypads

- Should be placed on the entry route if used for arming and disarming
- Should be placed with the Control Panel if SmartKeys or the App's are used for arming/disarming

Movement Sensors

- Minimum of one per ground floor room.
- Should be placed looking into a room (not looking out of windows)
- Mounted at the correct working height 2Mtr - 2.4Mtr from the floor

Door Contacts

- The main body should be placed on the door frame
- The magnet should be placed on the door itself

Shock Sensors

- Should be mounted on the frames of doors or windows being protected

External Sounder

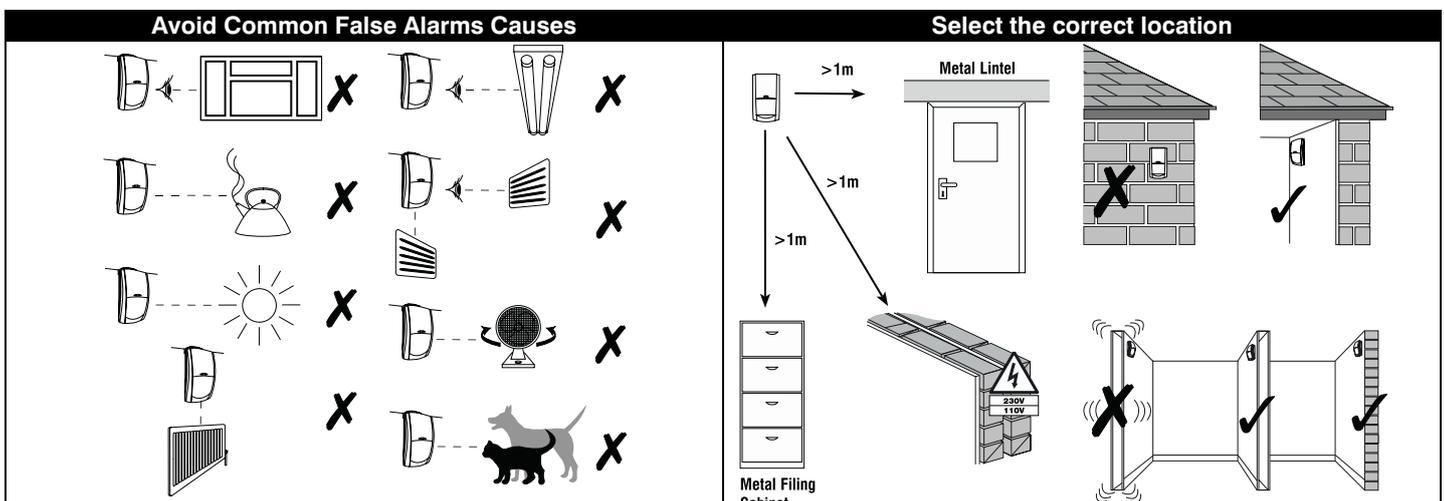

- Should be placed on a suitable external elevation to attract attention in the case of an activation.
- Should be accessible for future maintenance

Smoke Detector

- Should be placed in a central location with a minimum of one device per floor of the property. In the case of larger properties careful consideration should be given to the number of devices required. The coverage, mounting height and audible noise level from each device must be checked.

Device Locations

For all devices, unless specified that they are suitable for the application, please observe the following guidelines.

Installation Sequence

Control Panel

1. Install the control panel in the chosen location.
2. Power up the Control Panel, using the battery first method, and loading factory defaults. To do this proceed as follows:-
 - a. Connect Red battery lead.
 - b. Connect Black battery lead.
 - c. Hold down the Load defaults button on the PCB.
 - d. Press and release the battery kick start button.
 - e. Release Load Defaults button.
 - f. Any connected keypads or internal speakers may go into alarm
 - g. Enter the default Engineers Code 1234.
 - h. Enter the default Engineers code 1234 again.
 - i. Connect AC Mains
3. The Keypad display will now show "Confirm Devices", press /Yes and /Yes again to confirm that all connected keypads and expanders are accounted for..
4. The Keypad display will now show "Learn Ricochet".
5. Fit the provided jumper link on the control panel PCB to enable commission mode.

NOTE If a standalone Ricochet expander is used commission mode is enabled when the tamper circuit is open.

Keypad Types

Texecom provide a number of different styles of keypads. The image below shows the layout of the Premier LCDLP Keypad with iconic keys, a large screen and Proximity tag capability. The table details the equivalent keys of an alternate is supplied.

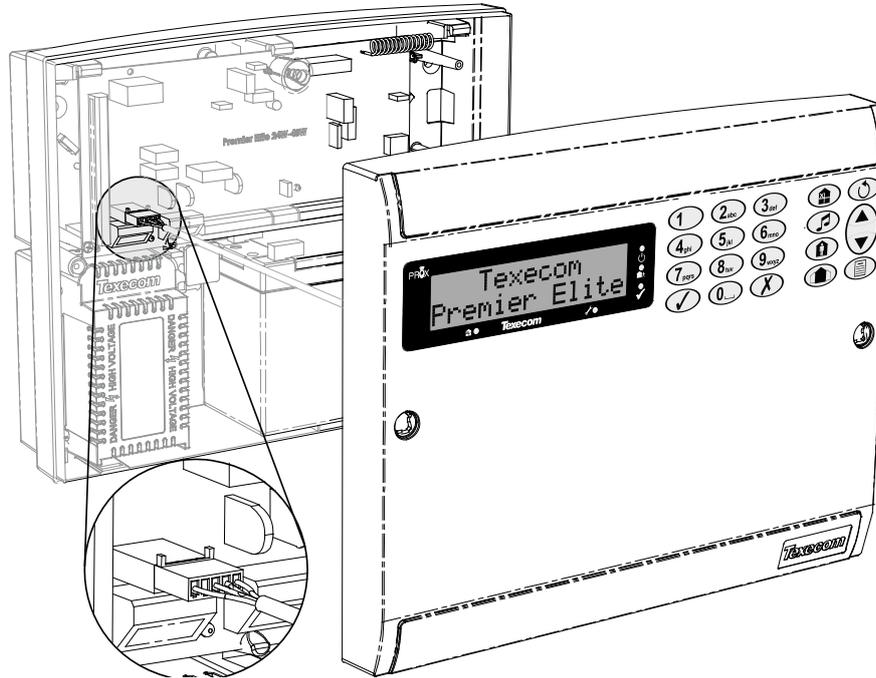

Keypad		Keys Guide				
		ICONS		UK English		English
			=	Omit	=	Bypass
			=	Chime	=	Chime
			=	Part	=	Stay
			=	Area	=	Area
			=	Reset	=	Reset
			=	Menu	=	Menu
			=	Yes	=	Yes
		OK	=	Yes	=	Yes
			=	No	=	No
		LED Symbols				
	=	Power		=	Ready	
	=	Armed/Info	OK	=	Ready	
	=	Omit		=	Service	

Connecting Keypads & Expanders

Before connecting keypads, zone expanders and output modules, isolate ALL power from the control panel (AC Mains & Battery). Do not continue if there is still power present on the control panel.

Premier Elite 12/24 & 48-W Live Front

Panels with an integral keypad are already wired and should be connected as shown.

Connecting devices with power still present on the control panel may damage the device or control panel and invalidate any warranty.

Keypads, zone expanders and output modules are all connected to the same network terminals located at the bottom left hand corner of the control panel and may be connected serially (daisy chain), in parallel (star) or any combination of the two (see Figure 1, page **Error! Bookmark not defined.** for details).

No more than 8 zone expanders, 8 keypads and 4 output modules can be connected to each network.

The maximum number of devices that can be connected in total will depend on the control panel fitted.

Whenever new devices are connected to the networks, they must be confirmed onto the system using the 'Confirm Devices' menu option

Wiring the Network

The networks are made up of four terminals incorporating power and data. To ensure correct operation, all four terminals on the device must be connected to the corresponding terminals on the control panel, or previous device (see Figure 1, page **Error! Bookmark not defined.** for details). The table below shows each terminal and its description:

Terminal	Description
+	+12V Supply
-	0V Supply
T	Transmit Data
R	Receive Data

Devices can be connected using 4-core cable. However, it is recommended that 6 or 8-core cable is used as the spare cores can be used to 'Double Up' on the power connections if needed.

Standard 7/0.2 alarm cable can be used for most installations. However, under certain conditions it may be necessary to use screened cable. Cable used should be rated at no more than 10Ω per 100mtr's and should be clearly marked on the packaging.

Keypad & Expander Addressing

Each keypad or expander must be assigned an address using the DIL switches located on the left hand side of the PCB. The table below shows the addressing:

Address	DIL 1	DIL 2	DIL 3	DIL 4	
1	On or off	Off	Off	Off	
2	Off	On	Off	Off	
3	Off	Off	On	Off	
4	Off	Off	Off	On	
5 *	On	Off	Off	On	
6 *	Off	On	Off	On	
7 *	Off	Off	On	On	
8 *	On	Off	On	On	
Engineers	On	On	On	On	

NOTE Never set two keypads on the same network to the same address. Never set two expanders on the same network to the same address. It is OK to have a keypad and an expander using the same address.

Installing Ricochet devices

To ensure correct setup and operation of the Wireless Network it is important that the following procedures are used when learning and placing devices.

Learning Devices

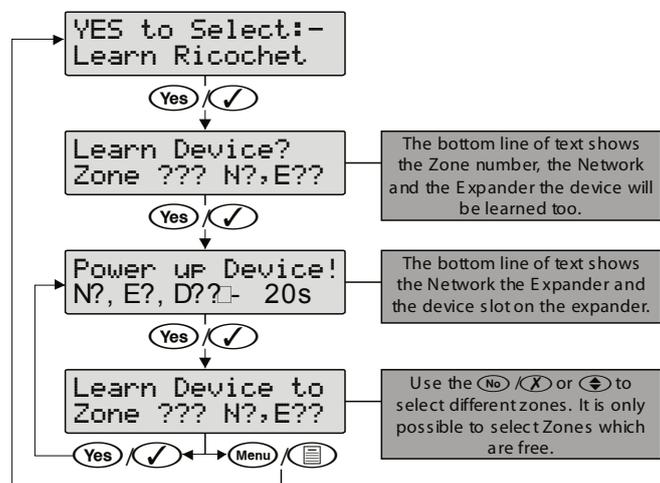

All devices should be learnt **before** they are placed in their final location. The expander should be in commission mode, as above. This will ensure that they are registered on the receiver or control panel, and that Mesh Networks and routing are established correctly. SmartKey should be learned after all other devices have been assigned to the system and are in their final location.

The following table details the method for powering up and learning each type of device.

Device Type	Learn method
Premier Compact All models	Pull battery tab or Insert battery
Impaq Contact & Plus	Short learn pins and insert battery
Odyssey-W	Insert batteries and move Battery Jumper to ON position
OH-W & PA-W	Pull battery tab or Insert battery
Premier Elite QD/XT & DT	Hold down learn switch & insert battery.
SmartKey	Power on

NOTE Devices should be at least 30cm's away from the receiver when being learned.

Referring now to your system design plan, learn all devices to the control panel. To learn devices to the system follow the diagram below. Ricochet devices will start at Zone 9.

Auto Zone Type & Area

When learning devices, if no editing has taken place of the control panel onboard hardwired zones, these will be switched to Not Used after the first *Ricochet* device is learned to the system; the following defaults will be used for *Ricochet* devices learned to the system.

Zone	Type	Area
001-008 (Hardwired)	Not Used	N/A
009 (Wireless)	Entry/Exit 1	A
010 (Wireless)	Guard Access	A
011 & above (Wireless)	Guard	A

When all device slots have been used the following screen will be shown

```
All Devices
Learnt!
```

Pressing the /Menu key will return you to the *Ricochet* learn menu; pressing the /Reset key will enter the Delete devices menu.

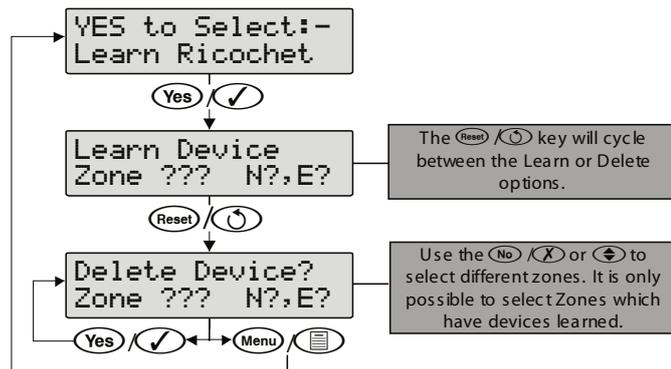

Deleting Devices

Delete Devices

If you make a mistake you can remove devices from the system and start again. To delete devices from the system, access the *Ricochet* Learn menu. Any of the methods previously detailed may be used.

The /Reset key is used to access the Delete option.

Follow the flow diagram below to delete devices from the system.

If all devices are deleted from the system the following will be shown

```
All Devices
Deleted!
```

Pressing the /Menu key will return you to the *Ricochet* learn menu; pressing the /Reset key will enter the Learn devices menu.

Once you have finished Learning devices press the /Menu key, the display will show

```
YES to Select:-
Learn Ricochet
```

Placing Devices

Once all of the devices have been learnt, they will need placing in their desired location, this should be done by installing devices closest to the Control Panel first and then working outwards so that the last devices installed are those furthest away from the control panel.

Make sure to install devices with the receiver in Commission mode

Devices also have a commission mode which will indicate a secure and valid path of communication to the receiver. (when the tamper circuit is closed the LED will flash to indicate communication, and then come on solid once communication has been established).

NOTE You should wait at least 20 minutes after installing the last device to make sure routing has been correctly established between all system devices.

NOTE For maximum reliability and system integrity avoid long and thin set-ups.

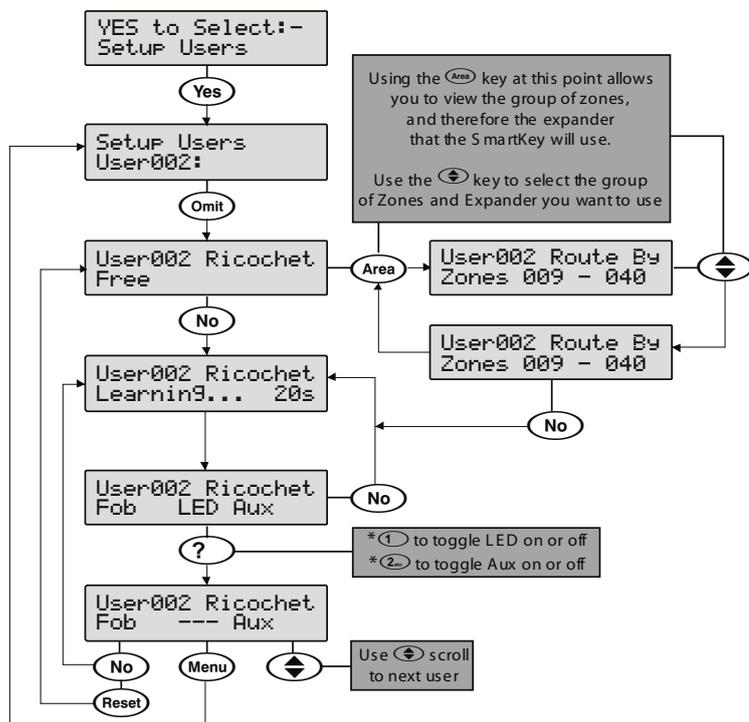

NOTE Devices are capable of hopping through up to two other devices, or a maximum of three hops.

Learning SmartKeys

Once all of the other devices have been mounted in their final location you may learn the SmartKeys to the system. The following procedure should be used:-

1. The keypad display will be showing YES to Select:-
Learn Ricochet
2. Press 8 on the keypad
3. The Keypad will show YES to Select:-
Setup Users
4. Follow the sequence below to learn SmartKeys for the users of the system.

* Please refer to INS 467 "Premier Elite SmartKey" for further details on the LED & Aux functions.

NOTE Once the 16 slots on a XP-W are taken up, the learn process will fail and display 'No spaces left'.

NOTE In either of the Premier Elite SmartKey™ menu displays, any Premier Elite SmartKey™ that logs onto the system will cause the menu to change to that Premier Elite SmartKey™ - a handy way of finding out which user a Premier Elite SmartKey™ in your hand belongs to!

Deleting a Premier Elite SmartKey™

Deleting the Premier Elite SmartKey™ from the user is a similar process to learning, at the appropriate point in the menu press **No** followed by **Reset**, the Premier Elite SmartKey™ will be removed from the User. To delete all user data see INS176-8 or later.

Finishing the Installation

Install all of the covers to the devices and the external sounder if fitted. and the proceed as follows:-

1. Remove the jumper link from Commission jumper on the panel PCB.
2. Fit the panel lid
3. Now test the system.

Testing the System

Now that all of the devices and SmartKeys have been learned to the system, the system should be checked to ensure everything works as desired.

1. Press the / (Menu) key
2. Press **9** and then / (Yes)
3. Press **1** to do a Bell test and follow the instructions on the screen
4. Press / (Menu) key
5. Press **2** and then / (Yes) to walk test all of the devices

Once testing is complete Press / (Menu) and exit and log off of the system.

Further Programming Options

Quick Programming Guide

The tables below show all of the available programming options when in Engineering mode. Some examples of common changes required for a new installation are shown. Further detailed instructions can be found in INS176-X Premier Elite Installation Manual which is on the enclosed CD or available to download from our website.

	Press - to enter zone number or use to search, , Of to select Part Arms 1, 2 or 3		
	Part Arm 1	Part Arm 2	Part Arm 3

Changing the default codes

When the control panel is first powered up and the factory default settings are loaded only the Engineer code and the Master User code exist.

The Factory default Engineer User code is .

The Engineer is always User 00.

The Factory default Master User code is

.

The Master User is always User 01.

If the Master User code has been lost or forgotten, it can be reprogrammed by the Engineer in this menu.

Changing the Default Codes

To change the default User Code proceed as follows:-

Users with access to this option can change their own User codes. User codes are unique to each user and can be 4, 5 or 6 digits long.

Before changing the codes, it is vital that you memorise or write down the new code you are about to program.

User

-
- Press
- Press
- Enter
- Press
- Enter a new 4, 5 or 6-digit User code
- Press to accept the new code
- Press
- Press again
- Press to exit the menu The display will return to normal

Engineer

-
- Press
- Press
- Enter
- Press
- Enter a new 4, 5 or 6-digit User code
- Press to accept the new code
- Press
- Press again
- Press to exit the menu The display will return to normal

Changing the Time & Date

Time

1. Enter the User Code (?) (?) (?) (?)
2. Press (Menu)
3. Press (Yes)
4. Press (7) (POS)
5. Press (Yes)
6. Enter the new time (?) (?) (?) (?)
7. Press (Yes)
8. Press (Menu)
9. Press (Reset)
10. Press (Yes) to exit the menu The display will return to normal

Date

1. Enter the User Code (?) (?) (?) (?)
2. Press (Menu)
3. Press (Yes)
4. Press (7) (POS)
5. Press (Yes)
6. Enter the new time (?) (?) (?) (?)
7. Press (Yes)
8. Press (Menu)
9. Press (Reset)
10. Press (Yes) to exit the menu The display will return to normal

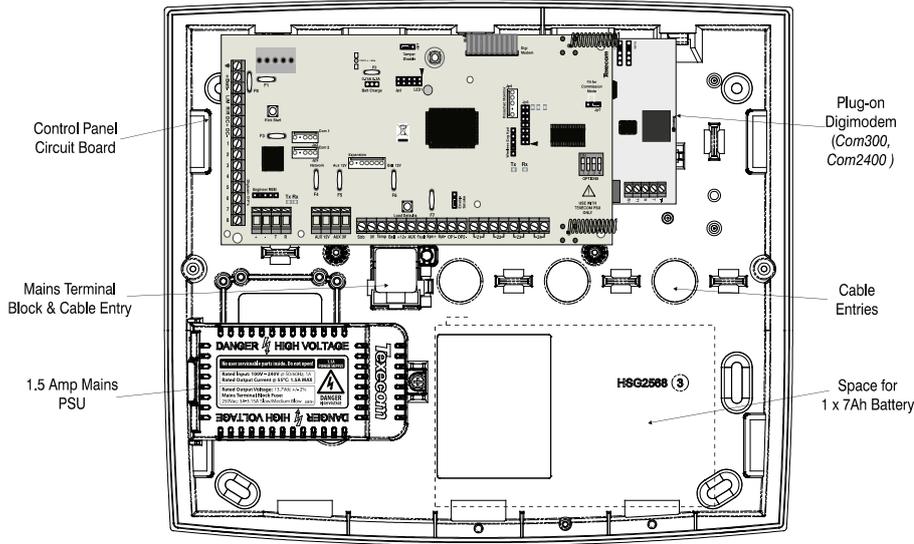

To programme any advanced features of the system, or to add codes for users, add device descriptions etc...Please refer to INS176- on the enclosed CD.

Control Panel Features

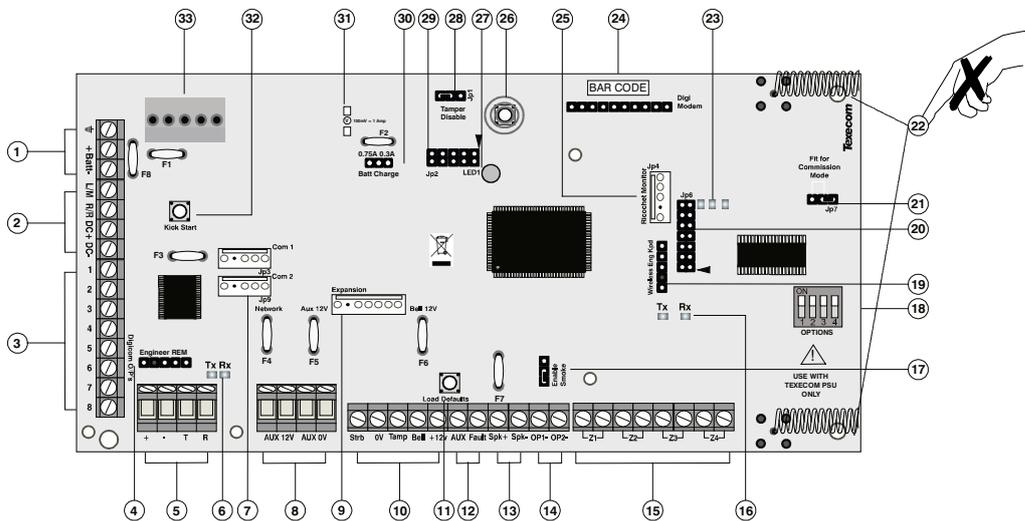

Premier Elite 12-W/24-W/48-W

- 4 Onboard Zones
- Max 8,16 or 32 wireless device **Ricochet** enabled receiver onboard
- Expandable to 12-48 zones via keypads and zone expanders
- 1 x 4-wire data network (standard 7/0.2 alarm cable)
- Up to 4 keypads (2 only on the 12-W) and 0-3 zone expanders
- Up to 2 output modules (0 on 12-W)
- 2 or 4 independent areas each with 3 part arms
- 2 or 4 area arm suites
- 8 (12-W), 25 (24-W), or 50 (48-W), programmable User codes
- 250 (12-W) or 500 (24-W/48-W) Event Log (time & date stamped)
- 1 or 2 programmable panel outputs (2 x 500mA)
- 1.5 Amp power supply
- 3 or 8 programmable digicom outputs (100mA each)
- 32 character zone text
- Facility for Plug-on Digimodem (Com300/2400)
- Facility for Plug-on GSM Module
- Facility for Plug-on IP Module (ComIP/Chiron/WebWayOne/Emizon) or any supported device
- PC-Com/printer port

Control Panel Layout (Premier Elite™ 48-W Shown)

PCB Layout (48-W Shown)

1: Battery Connections

A 12V rechargeable battery must be connected to these terminals in order to provide continuous system operation in the event of an AC Mains failure. (protected by 1.6 Amp PTC Fuse)

2: Digicom Power & Inputs (24/48-W Only)

These terminals provide un-fused power; remote reset and line fault inputs and are normally used for connecting a stand-alone communicator to the control panel.

3: Digicom Outputs

Outputs 1 to 8 are low current (100mA '-ve' applied) and would normally be used when connecting a stand-alone communicator to the control panel. Each output is fully programmable.

NOTE Outputs 4-8 are not fitted on the 12-W

4: Engineers Keypad

A portable Engineers keypad can be plugged on here to allow easier access for programming and testing.

NOTE When using a keypad as an Engineers keypad, the address must be set to '10'. The keypad zones and lid tamper are not monitored.

5: Network Data Connections

Network 1 provides connection for the keypads and zone expanders. The '+' and '-' terminals provide power whilst the 'T' transmits data and 'R' receives data.

6: Network Data Indicators

The red LED indicates that data is flowing out of the control panel and normally flashes very quickly. The green LED indicates that data is flowing into the control panel and normally flashes slowly, the green LED flashes faster as more devices are connected.

7: Communication Ports

Com Port 1 is a serial communications port and can be used for connecting a PC running *Wintex* or any supported serial device to the control panel.

Com Port 2 is a serial communications port and can be used for connecting a PC running *Wintex* or any supported serial device to the control panel.

8: Auxiliary 12V Power

These terminals are for connecting devices that require 12V power (protected by a 0.9A PTC fuse).

9: Expansion

The Expansion Port can be used for connecting a 60XiD Zone Expander or an AV Module.

10: External Sounder Connections

These terminals are used for connecting to an external sounder unit.

11: Load Defaults Button

Press and hold this button whilst applying power to the control panel to load the factory default settings. Press and hold this button for 7 seconds with power already on the panel to restore just the Engineer code to the factory setting of (1) (2_{abc}) (3_{def}) (4_{ghi}).

NOTE Loading the factory defaults can take up to 60 seconds to complete.

Loading defaults will only be possible if the NVM has not been locked.

For a complete list of factory defaults, see the **Premier Quick Reference** supplied on the enclosed CD.

12: Auxiliary Tamper/Fault Connections

These terminals can be used for monitoring the tamper loop of an auxiliary device.

13: Loudspeaker Connections

These terminals can be used for connecting up to one 8Ω or two 16Ω loudspeakers.

14: Panel Outputs

Outputs 1 & 2 are 500mA '-ve'. These outputs are all fully programmable.

NOTE Output 2 is not programmable on the 12-W & 24-W

15: Zone Connections

4 Fully programmable zone inputs

16: Ricochet Network LED's

Green LED = Data received by the expander from the panel
Red LED = Data transmitted by the expander to the panel. *(The flash rate depends on the mode and RF activity)*

17: Enable 2 wire smoke (24/48-W Only)

Panel Output 1 can be used for connecting up to 10, 12V 2-Wire smoke detectors.

18: Options Switch

Use to select the receiver functionality.

Switch 1 OFF = not used on Premier Elite 24/48-W.

Switch 2 OFF = Premier Elite 24/48-W Ricochet Mode

ON = Not Used

Switch 3 ON = Impaq Contact-W Wired Input 2 will report as Tamper (default)

OFF = input 2 will report as an Alarm.

Switch 4 OFF Walk test

19: Ricochet Eng keypad connection

An engineer's keypad (*Premier LCD* keypad and interface lead) can be temporarily plugged onto this connector to allow system programming and testing. Set the keypad address switches to all ON.

20: Ricochet Firmware Flash Port

Connections for flasher interface to update Ricochet receiver firmware. (factory function only)

21: Commission Mode Jumper

Fit when learning and placing devices, remove once complete.

22: Antenna

RF antenna

23: RF LED's

Left = RED Transmit, Middle = GREEN Receive, Right = RED Wireless Network Tick.

24: Plug-on Communicator Connections

This socket provides connection for Premier COM300/COM2400 plug-on communicators via the lead provided.

25: Ricochet Comm. Port Connection (24/48-W Only)

Serial communications port for connecting to a PC via PC Com/USB Com or Com IP for use with Ricochet Monitor Software.

26: Cover Tamper

Provides tamper protection for the control panel.

27: Heartbeat LED/Power Light

Flashes steadily to indicate that the control panel is functioning correctly. If the light is ON or OFF all the time, then there could be a problem.

28: Cover Tamper Disable

Disables the lid tamper

29: Flash Programming Port

For upgrading the panel firmware.

30: Battery Charge Selection(24/48-W Only)

Select .03A or 0.75A battery charging current

31: Current Reading Pads

To calculate the current draw of the control panel, measure the voltage across the two pads and multiply by 10 i.e. Reading = 34mV (x10) = 340mV = 340mA.

32: Battery Kick-start Button

When powering up the panel without AC Mains present, this button must be pressed in order to connect the battery. If AC Mains is present this button does not need to be pressed.

33: Power Supply Connection

Only for use with the Texecom PSU.

DO NOT CONNECT ANY OTHER MAINS SUPPLY TO THESE TERMINALS

PTC Protection Fuses

The following fuses are provided:

F6 PTC (0.9A) Auxiliary 12V Power fuse

F4 PTC (0.9 A) Network 1 fuse

F5 PTC (0.9 A) Bell/Strobe fuse

Texecom

Texecom Limited, Bradwood Court, St. Crispin Way, Haslingden, Lancashire BB4 4PW, England.
